Pneumatic Powered - Plunger Pumps

Suggested Installation & Operating Instructions for Sidewinder Pumps

See Suggested Pump Installation and System Set Up Diagram (inside) and Pump Breakdown (inside)

- 1) When installing pump, manufacturer recommends the use of 316SS tubing rated for the maximum discharge pressure of the specific pump model being used. **DO NOT USE** poly tubing, copper tubing, or seamed tubing as a discharge line. Use of incorrect material may result in discharge line failure leading to personal injury, death, and/or compromise to the injection objectives. For Safety Purposes and Good Engineering Practice, manufacturer recommends placement of a properly sized Pressure Relief Valve (PRV) / Pressure Safety Valve (PSV) on the pump discharge line at the pump, with the relief line plumbed back to the chemical tank (#7).
- 2) Install pump setting gauge (#9) onto chemical tank (#7), with an isolation ball valve (#8) between tank and gauge.
- 3) Install pump with suction filter (#11) with isolation ball valve (#8) between pump and pump setting gauge (#9).
- 4) A regulator (#2) should be installed in the air/gas supply line to provide correct supply of air/gas pressure. Connect air/gas supply line from regulator (#2) to the pump supply inlet using 1/4" NPT tee with 0-150 PSI gauge. An isolation ball valve (#5) should be installed between air/gas regulator (#2) and the pump. Use minimum of 3/8 inch diameter tubing (#3) with a maximum distance of 10 feet from regulator to the pump. If longer distance is required or multiple pumps are run off same supply line, a volume bottle (#4) should be installed within 5 feet of the pump(s).
- 5) If the air/gas supply is "wet", a volume bottle (#4) with a drain and filter should be installed in between the regulator (#2) and pump(s) as close as possible to the pump(s). If the air/gas supply is extremely "wet" a scrubber (#1) should be installed on the main flow line with regulator taking its supply from the scrubber.
- 6) Set the regulator (#2) to required pressure. See Pump Selection Guide and Performance Chart
- 7) Connect discharge line to the 1/4 inch NPT discharge check valve. For good safety practice an in-line check valve (Sidewinder part number LC-4S) (#10) should be installed on the discharge line at the injection point.
- 8) If natural gas is used as the supply gas, pump exhaust should be vented via the 1/8" NPT threaded port on the control valve body (#53) to safe disposal area or non pressurized disposal device
- 9) Open bleeder valve (#20 Pump Breakdown) until air removed from pump chamber. Isolate pump setting gauge (#9) from tank. Open air/gas isolation valve (#5) to pump. Run pump following directions on pump setting gauge to determine flow rate.
- 10) Adjust speed of pump by rotating dial (#31 Pump Breakdown), clockwise to decrease number of strokes per minute, counter clockwise to increase number of strokes per minute. Further volume control can be set by varying the length of the piston/plunger stroke with the stroke adjuster (#1 Pump Breakdown).
- 11) Reset isolation ball valves (#8) so pump takes chemical direct from tank (#7).

Pump Repair or Emergency Shut Down

- 1) To perform repairs to the pump or to the pump setting gauge, close the air/gas supply isolation ball valve (#5), close both isolation ball valves (#8) between tank (#7) & gauge (#9) and pump & gauge (#9). Remove component(s) to be repaired. After repair, reinstall component(s). Open isolation ball valve (#8) between tank (#7) and gauge (#9), check for leaks. Open isolation ball valve (#8) between pump and gauge (#9), check for leaks. Perform steps 8 thru 10 above.
- 2) **In event of an emergency the following steps are to be done in the following order**
 - i) Close air/gas supply isolation ball valve (#5)
 - ii) Close isolation ball valve #8 between pump setting gauge (#9) and chemical tank (#7)
 - iii) Close isolation ball valve #8 between pump and pump setting gauge (#9)

91*#	1	Piston Grease	91-42	91-42	91-42

Notes

* Parts included in a pump end repair kit. This kit is designated by a "K" preceding the pump model number. The D and F Series in the Model 40/60/80 use the same Pump End Repair Kit.

** Parts included in a timer valve repair kit. This part number is KVC-40F for the Model 40, Model 60, and the Model 80 pump.

Parts included in Soft Parts Repair Kit. This kit is designated by a "K" preceding the pump model description and the seal identification number. Example: Soft Parts Kit for a model 42C-032 pump would be K42C-3.

^a Item 6 - Piston U-Cup in Viton - Part # 6-42-2.

^b Item 11 - Return Spring available in Ni Cobalt Moly - part number # 11-42-MP.

Theoretical Fluid Volume Pumped

Numbers are approximate; to insure accurate flow rates Sidewinder Pumps recommends installing a Pump Setting Gauge.

Quarts/Day = 1.5 x Strokes/Min. for 1/4" Plunger

Quarts/Day = 3.0 x Strokes/Min. for 3/8" Plunger

Quarts/Day = 6.0 x Strokes/Min. for 1/2" Plunger

At high pump rates, volume per stroke is reduced slightly.

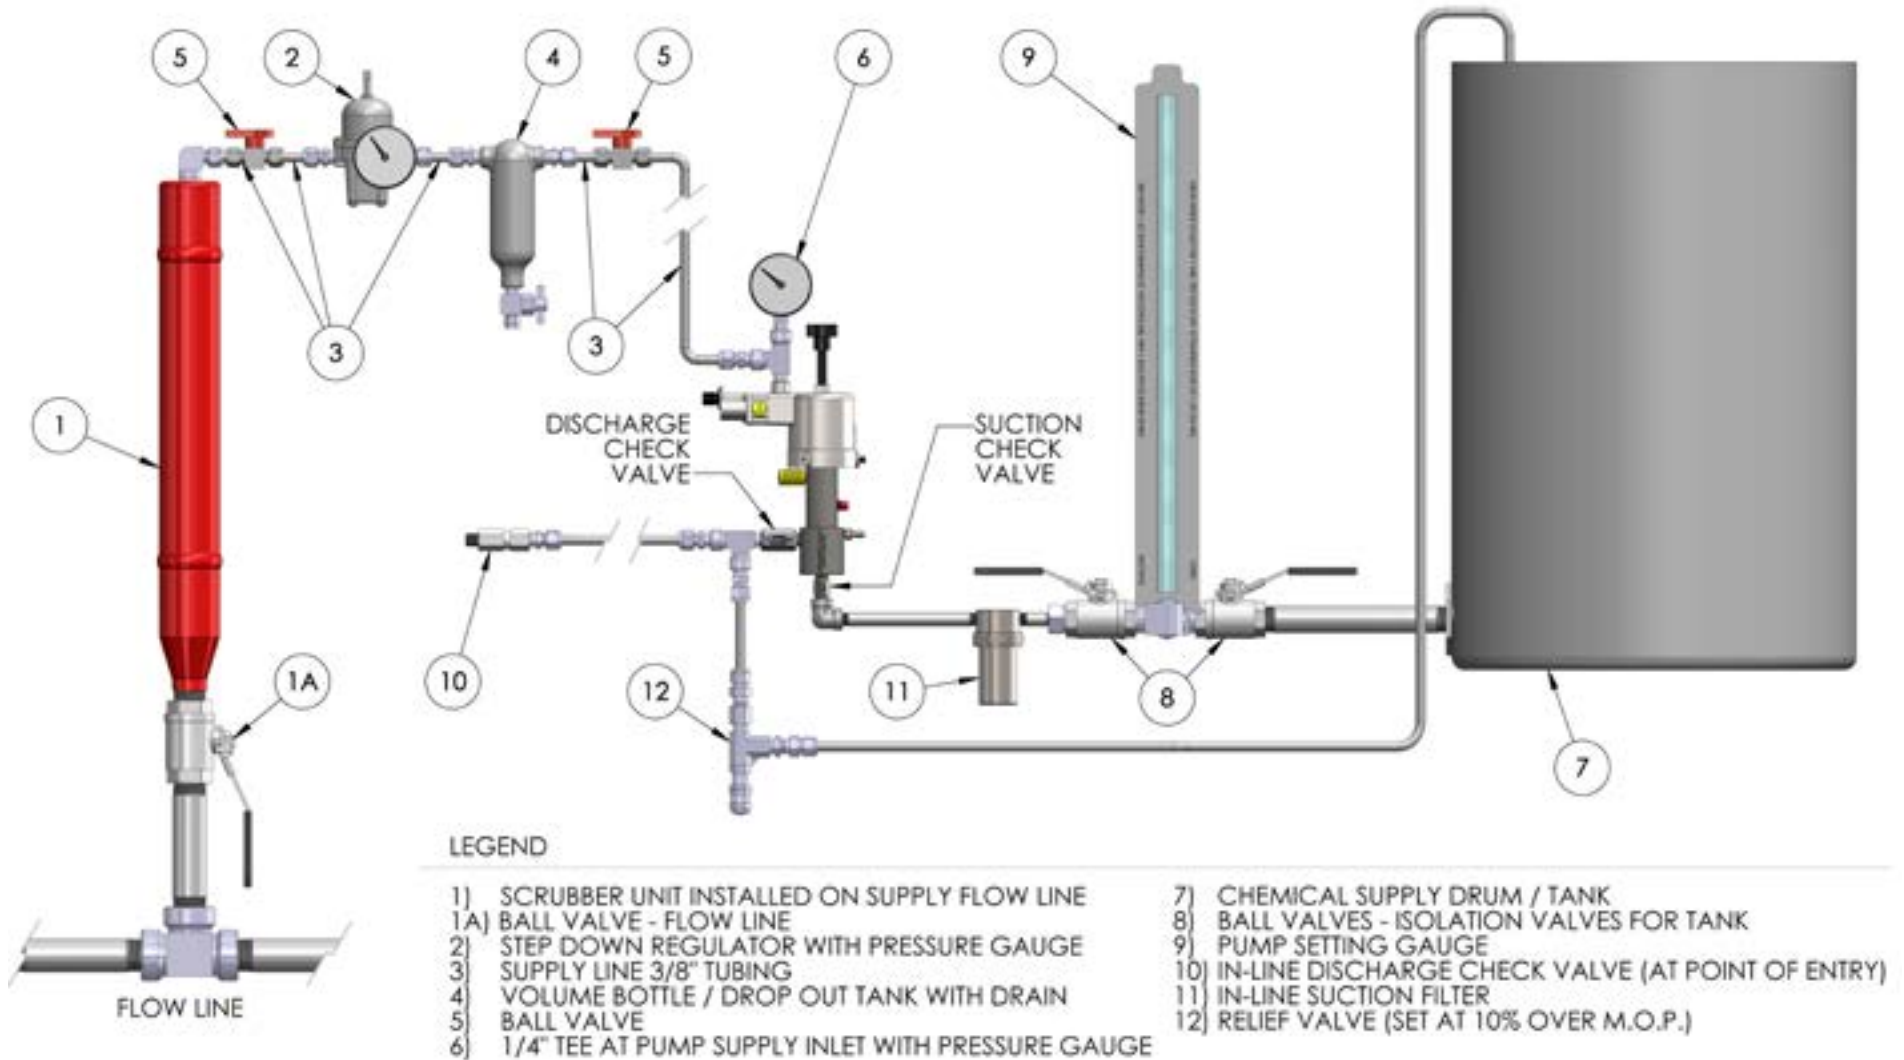

Rule of Thumb:

For 1/4" Plunger, 1 spm = 1.5 Qt/Day • For 3/8" Plunger, 1 spm = 3.0 Qt/Day • For 1/2" Plunger, 1 spm = 6 Qt/Day

Suggested Pump Installation and System Set Up

There ain't no better pump

Troubleshooting The Sidewinder Chemical Pump

Problem	Possible Cause	Action
Control valve not cycling	<ul style="list-style-type: none"> No supply pressure Pump speed control closed Leak in control or valve Supply gas blowing through to exhaust due to speed control too wide, trash under valve seat or restriction in air/gas supply 	<ul style="list-style-type: none"> Check gauge on supply line at pump to verify adequate supply pressure... 10 to 150 psi. Rotate dial CCW three turns from full in position and then select desired rate. Rotate CW to slow pump rate Check for leak, pinched or missing seals, broken diaphragm, loose mounting screws, loose lock down nut on stroke adjuster. Rotate control dial CW to decrease setting. Block exhaust momentarily and then release. Verify supply line size minimum of 3/8" diameter, and a maximum distance from regulator to pump of 10 feet . Check for blockage in supply line and Timer Control. For pumps before serial #40755, contact the manufacturer.
Piston not stroking	<ul style="list-style-type: none"> Return spring broken Lack of grease/lube Plunger seal swollen Supply line pressure too low to buck process line pressure Stroke length adjuster screwed too far 	<ul style="list-style-type: none"> Replace spring (#11). Clean and lubricate power head and piston u-cup with Piston Grease #91-42. Clean plunger lube chamber and fill with Sidewinder Lube #92-42 on liquid lube models or with Sidewinder Grease #91-42 on grease lube models. Change piston and plunger seals if needed. Change to different seal material. Divide process line pressure by amplification ratio (see Performance Chart). Supply pressure must exceed this result. (Standard Sidewinder Control operates from 10 to 150 psi). Back out on stroke adjuster to desired setting.
No fluid discharge with timer control cycling and piston stroking	<ul style="list-style-type: none"> Air or vapor in pump chamber Fluid flow to pump blocked by plugged line, closed valve, extremely high viscosity or lack of fluid supply Suction or discharge check valve leaking Discharge line plugged Chemical filter clogged 	<ul style="list-style-type: none"> Open bleeder valve (#20), purge until steady flow of fluid, then close bleeder valve. If ambient temperature is close to vapor point of chemical, mount or situate pump on slight angle down from tank. Provide free flow of fluid to pump suction. Fluid level in tank must be above level of bleeder valve (#20). Put pump setting gauge in test position to determine which valve is leaking. Fluid falling then rising in gauge indicates suction check valve. Fluid level remaining constant indicates discharge check valve issue. Clear or replace line. Replace or clean filter element.
Premature seal failure	<ul style="list-style-type: none"> Chemical compatibility Abrasive material in chemical No seal lubriant or incorrect lube 	<ul style="list-style-type: none"> Check the plunger first. If plunger is scored, switch to more compatible material such as ceramic, and replace with same seal material. If seal fails, change to a different seal material. If plunger is okay, change seal material. Install suction filter. Use Sidewinder Lube #92-42 in liquid lube models, use Sidewinder Grease #91-42 in grease lube models.
Chemical leakage	<ul style="list-style-type: none"> Damaged or leaking suction line, discharge line or seal failure 	<ul style="list-style-type: none"> Close air/gas supply isolation ball valve (#5). Close isolation ball valve (#8) between pump setting gauge (#9) and chemical tank (#7). Close isolation ball valve (#8) between pump and pump setting gauge (#9). Close isolation ball valve between tee (#4H) and exhaust collection point.
Air/Gas supply leakage	<ul style="list-style-type: none"> Damaged or leaking Air/Gas Supply Line 	<ul style="list-style-type: none"> Close air/gas supply isolation ball valve (#5). Close isolation ball valve (#8) between pump setting gauge (#9) and chemical tank (#7). Close isolation ball valve (#8) between pump and pump setting gauge (#9). Close isolation ball valve between tee (#4H) and exhaust collection point.

NOTE: When performing repairs, follow the suggested procedures as described in Pump Repair or Emergency Shut Down section

NOTE: In the event of an emergency shut down, follow the suggested procedures as described in the Pump Repair or Emergency Shut Down section

NOTE: Item numbers referenced are in the Suggested Pump Installation and System Setup Diagram and Pump Breakdown

Pump Selection Guide & Performance Chart
